

The James Webb Space Telescope

“Hubble 2.0”

Will Handley
wh260@cam.ac.uk

Gonville & Caius College
Cavendish Astrophysics Group

31st October 2022

Disclaimers

- ▶ I am not on the JWST team
 - ▶ like every astronomer it will continue to have a large impact for many decades
- ▶ JWST has been taking images for half a year now, but only a fraction of them are public
- ▶ This talk is designed to give you a framework to interpret any news stories
- ▶ Hope for a more new-science focussed talk next year.
- ▶ Structure of talk
 1. Orienting our place in the universe
 2. Description of the JWST observatory
 3. Discussion of the science it is interested in
 4. Latest pictures from JWST

Statistics

Where Second lagrange point (L2)

When 5-10 year lifetime

Size ▶ 6.5 meter mirror ($2.5\times$
Hubble [$6\times$ area])
▶ Tennis court sized
sunshield

How Infrared

How much? \$10 billion

How far? ~ 13.6 billion years ago

Webb's Journey from Launch to L2

EARTH

Launch

Launch Vehicle Separates

Distance: ~ 10,000 km
~ 29 min

Solar Array Deploys

Distance: ~ 11,000 km
~ 33 min

Mid-Course Correction

Trajectory Burn
Distance: ~ 133,000 km
~ 14 hours

Sunshield Pallet Deploys

Distance: ~ 454,000 km
~ 3 days

Initial Sunshield Deploys

Distance: ~ 658,000 km
~ 6 days

Sunshield's Layers Separate

Distance: ~ 677,000 km
~ 8 days

Secondary Mirror Unfolds

Distance: ~ 952,000 km
~ 10 days

Primary Mirror Wings Deploy

Distance: ~ 1,000,000 km
~ 13 days

2nd Mid-Course Correction

Trajectory Burn
Distance: ~ 1,400,000 km
~ 29 days

L2 Halo Orbit Begins

Science on the JWST

As a space-based observatory it aims to

- ▶ to search for light from the first stars and galaxies that formed in the universe after the Big Bang
- ▶ to study galaxy formation and evolution
- ▶ to understand star formation and planet formation
- ▶ to study planetary systems and the origins of life

Scientific instruments

- ▶ 17 different “modes” spread across 4 instruments

NIRCam Near Infrared Camera (10×4 MegaPixels HgCdTe)

- ▶ Most of front-page images are with this in its camera mode
- ▶ Also a spectrometer & coronagraph
- ▶ 29 filters & resolutions
- ▶ Cooled to 37K by sunshield

NIRSpec Near Infrared Spectrograph. (2×4 MegaPixels).

- ▶ Three resolution modes in grating wheel assembly + 5 filters

MIRI Mid-Infrared instrument

- ▶ Cooled to < 7 K by cryocooler
- ▶ Builds on legacy of Hubble + coronagraphy

NIRISS Near Infrared Imager and Slitless Spectrograph

- ▶ Single object spectroscopy
- ▶ Aperture masking interferometry
- ▶ Backup to NIRCam
